[^0]:    1) When variable transducer supply is used, there is no electrical isolation from the supply.
    2) Hub: FireWire node point or distributor
    3) Hop: transition from module to module/signal conditioning
    4) Mechanical stress is tested in accordance with European standards EN60068-2-6 for vibration and EN60068-2-27 for shock. The devices are exposed to an acceleration of $50 \mathrm{~m} / \mathrm{s}^{2}$ within the frequency range $5 \ldots 65 \mathrm{~Hz}$ in all 3 axes. Duration of this vibration test: 30 minutes per axis. The shock test is implemented at a nominal (rated) acceleration of $350 \mathrm{~m} / \mathrm{s}^{2}$ for a duration of 6 ms , half sine and with shocks in each of the six possible directions.
[^1]:    *) The delay of the A/D converter is $293 \mu$ s for all data rates, it has not been accounted for in the "Phase delay" column!
